

Anton May

 [ehtbantton](#) |  [antonpmay](#) |  anton.may@new.ox.ac.uk |  +447849262611

Final-year Oxford engineer who gets engrossed in hard, badly-specified problems. I place care towards the failure modes most people skip, because that's what makes a non-deterministic end-to-end system reliable rather than just demoable.

WORK EXPERIENCE

Cofounder & CTO - Cantic Ltd May 2026 - present

- Leading engineering for [Cantic](#), an in-path proxy between a company's AI agents and their model provider that blocks the tool calls breaking the customer's rules
- Owning the gateway, enforcement engine, and hash-chained ledger, reconstructing streamed SSE tool-call deltas to block a forbidden action before the agent acts
- Live in production within three weeks with eight companies routing agents through us; interviewed at Y Combinator and raised \$200,000 at a \$3M post-money valuation

Software Engineer - Big Data Institute, Oxford Jun 2025 - Oct 2025

- Revamped [AIDA-3D](#), a 3D medical image viewer, from a 3-year-old untouched demo into a useful tool for arbitrary web-hosted data aligned with the OME-Zarr v0.5 spec
- Reverse-engineered undocumented data pipelines with no external guidance to make the system maintainable
- The project group secured €2M in grant funding in March 2026, supported by the voluntary contributions I continued to make to the viewer after my internship had ended

Software Development Intern - Valor Carbon Aug 2025 - Sep 2025

- Built an automated document generation tool using LLMs and RAG; deployed securely on Oracle Cloud
- Cut scope hard, as most proposed agentic use cases didn't justify their complexity

LLM Performance Evaluator - Outlier Dec 2024 - Apr 2025

- Evaluated LLM outputs for accuracy and clarity; provided feedback for C++ and mathematical reasoning

Academical Clerk - New College, Oxford Oct 2022 - present

- Performing daily as a professional singer in a globally renowned choir alongside my studies.

PROJECTS

ThirdEye - Navigation for the Visually Impaired Nov 2025 - present

A discreet IoT wearable (baseball cap) with an integrated stereo camera that connects to a mobile companion app to create stereoscopic depth maps, perform YOLO object recognition, and call GPT-4-mini to build a usable model of the user's environment. Selected as a Scholar at HackEurope 2026, Europe's largest student hackathon, to extend the project, and won €500 at a Cambridge AI founders demo day hosted by Oxbridge AI X. The wearable has also been submitted to the Microsoft Imagine Cup.

Exammer - Cofounder Sep 2025 - present

A verified knowledge portfolio for a world where a certificate no longer proves much ([exammer.co.uk](#)). A platform where anyone can get credit for what they actually study, featuring a phone-call style AI interviewer with an interactive whiteboard which marks you as you go, and RAG lookup on conversations to prove a user's subject-specific work to employers.

Quantext - Quantum Dice Competition Winner Nov 2025

A QUBO-based RAG algorithm addressing a known flaw in LLM context retrieval on massive, cluttered datasets, built for Quantum Dice's ORBIT platform. Won €1000 as the only undergraduate team in the top three.

(4YP) Analysing radiology reports using large language models Oct 2025 - present

My final year project: a tool to auto-label radiology reports with a fine-tuned local LLM, unlocking a large untapped source of medical imaging training data. The labels are worthless unless trusted, so most of the work is filtering the bad ones, benchmarked against the state of the art.

EDUCATION

MEng Engineering Science, University of Oxford Oct 2022 - Jul 2026

SKILLS

Languages	Python, TypeScript/JavaScript, C++, Rust, MATLAB
AI & ML	PyTorch, OpenCV, RAG pipelines, local LLM fine-tuning, agentic systems (MCP)
Systems & Cloud	End-to-end system design, distributed systems, Azure, Google Cloud, CI/CD
Tools & Domains	Git, IoT, medical imaging, 3D graphics, quantum computing
