

Anton May

 [ehtbanton](#) |  [antonpmay](#) |  anton.may@new.ox.ac.uk |  +447849262611

Final-year Oxford engineer who easily gets engrossed in an exciting new problem. I place care towards evaluating poorly defined failure modes so I can build reliable and safe non-deterministic end-to-end systems.

WORK EXPERIENCE

- Cofounder & CTO - Cantic Ltd** May 2026 - present
- Leading engineering for **PocketBot AI**, a proactive agentic to-do list that monitors a user's channels and automatically drafts ready-to-go solutions for their daily tasks
 - Pairing clear, trackable task presentation with a strict approval-before-execution model to deliver the speed of an AI assistant with far greater reliability and control than comparable agents
 - Secured the company's first venture backing of \$200,000 at a \$3M post-money valuation
- Software Engineer - Big Data Institute, Oxford** Jun 2025 - Oct 2025
- Revamped **AIDA-3D**, a 3D medical image viewer, from a 3-year-old untouched demo into a useful tool for arbitrary web-hosted data aligned with the OME-Zarr v0.5 spec
 - Reverse-engineered undocumented data pipelines with no external guidance to make the system maintainable
 - The project group secured £2M in grant funding in March 2026, supported by the voluntary contributions I continued to make to the viewer after my internship had ended
- Software Development Intern - Valor Carbon** Aug 2025 - Sep 2025
- Built an automated document generation tool using LLMs and RAG; deployed securely on Oracle Cloud
 - Learned that with agentic systems, it's best to focus on practical automation over forced implementation
- LLM Performance Evaluator - Outlier** Dec 2024 - Apr 2025
- Evaluated LLM outputs for accuracy and clarity; provided feedback for C++ and mathematical reasoning
- Academical Clerk - New College, Oxford** Oct 2022 - present
- Performing daily as a professional singer in a globally renowned choir alongside my studies.

PROJECTS

- ThirdEye - Navigation for the Visually Impaired** Nov 2025 - present
- A discreet IoT wearable (baseball cap) with an integrated stereo camera that connects to a mobile companion app to create stereoscopic depth maps, perform YOLO object recognition, and call GPT-4-mini to build a rich understanding of the user's environment. Selected as a Scholar at HackEurope 2026, Europe's largest student hackathon, to extend the project, and won £500 at a Cambridge AI founders demo day hosted by Oxbridge AI X. The wearable has also been submitted to the Microsoft Imagine Cup.
- Exammer - Cofounder** Sep 2025 - present
- The verified knowledge portfolio for the post-AI world (exammer.co.uk). A platform where anyone can get credit for what they study, featuring a phone-call style AI interviewer with an interactive whiteboard which marks you as you go, and RAG lookup on conversations to prove a user's subject-specific work to employers.
- Quantext - Quantum Dice Competition Winner** Nov 2025
- A QUBO-based RAG algorithm addressing a known flaw in LLM context retrieval on massive, cluttered datasets, built for Quantum Dice's ORBIT quantum compute platform. Won £1000 as the only undergraduate team to finish in the top three.
- (4YP) Analysing radiology reports using large language models** Oct 2025 - present
- My final year project. Building a tool to automatically label radiology reports using a fine-tuned local LLM, unlocking a huge untapped resource of training data for medical imaging models. Designing a checking system to filter errored labels and benchmarking against state-of-the-art approaches.

EDUCATION

- MEng Engineering Science, University of Oxford (predicted 2:1)** Oct 2022 - Jul 2026

SKILLS

Languages	Python, JavaScript/TypeScript, C++, Rust, MATLAB
ML/AI	PyTorch, OpenCV, RAG systems, local LLMs, MCPs for agentic AI
Web & Infrastructure	Azure, Oracle Cloud, Google Cloud, CI/CD, distributed systems
Other	Git, 3D graphics, medical imaging, IoT, quantum computing
